EC Screening — Project Report

Nov 6, 2026 · @Rohith K

We built a multi-agent service that pre-screens Indian projects for Environmental Clearance under the EIA Notification, 2006. It finds the Schedule row for a project's sector and capacity, checks whether the General Condition or an amendment changes the category, and returns a cited, advisory opinion: **Category A** (central ministry), **Category B** (state authority), **no clearance required**, or **escalate to a human**.

Mini Project 13, UE24AM342AA5 (ML System Design and AgentOps), PES University · Rohith Karning, P Manas Siddhardha, Rohanth Ganesha C, Raghav Budur

How it works

Two LangGraph agents run in separate containers behind an asynchronous API and a Redis queue. The General Condition, printed after the Schedule table, changes a project's category by location, so similarity search alone misses it; we index it as its own typed chunk and keep each Schedule row whole (all-MiniLM-L6-v2 embeddings in Chroma). One LLM gateway handles retries, a circuit breaker and cost tracking.

Evaluation and limitations

We score 23 scenarios, including the brief's section 4.1 case and 9.5, 10 and 10.5 km boundaries, on groundedness, context relevance, faithfulness, hallucination rate and route accuracy, comparing screener prompt v1 with v2. Our declared target is **p95 ⩽ 60 s** per run at 10 users, load-tested with Locust. Guardrails block prompt injection; Prometheus, Grafana and Jaeger trace every run; 72 tests run offline; one `docker compose up` starts all 12 services.

Limitations. Six sectors are covered, their Schedule text is pasted by hand because PDF tables extract badly, and lexical metrics can under-score a correct paraphrase. Next, we will add amendments to the corpus and record the evaluation and load-test results.
